# Useful Formulas for the Analysis of Algorithms

This appendix contains a list of useful formulas and rules that are helpful in the mathematical analysis of algorithms. More advanced material can be found in [Gra94], [Gre07], [Pur04], and [Sed96].

## **Properties of Logarithms**

All logarithm bases are assumed to be greater than 1 in the formulas below;  $\lg x$  denotes the logarithm base 2,  $\ln x$  denotes the logarithm base e = 2.71828...; x, y are arbitrary positive numbers.

**1.** 
$$\log_a 1 = 0$$

**2.** 
$$\log_a a = 1$$

$$3. \quad \log_a x^y = y \log_a x$$

$$4. \quad \log_a xy = \log_a x + \log_a y$$

$$5. \quad \log_a \frac{x}{y} = \log_a x - \log_a y$$

$$6. \quad a^{\log_b x} = x^{\log_b a}$$

7. 
$$\log_a x = \frac{\log_b x}{\log_b a} = \log_a b \log_b x$$

## **Combinatorics**

- **1.** Number of permutations of an *n*-element set: P(n) = n!
- **2.** Number of k-combinations of an n-element set:  $C(n, k) = \frac{n!}{k!(n-k)!}$
- **3.** Number of subsets of an n-element set:  $2^n$

## **Important Summation Formulas**

**1.** 
$$\sum_{i=l}^{u} 1 = \underbrace{1 + 1 + \dots + 1}_{u-l+1 \text{ times}} = u - l + 1 \ (l, u \text{ are integer limits}, l \le u); \quad \sum_{i=1}^{n} 1 = n$$

2. 
$$\sum_{i=1}^{n} i = 1 + 2 + \dots + n = \frac{n(n+1)}{2} \approx \frac{1}{2}n^2$$

3. 
$$\sum_{i=1}^{n} i^2 = 1^2 + 2^2 + \dots + n^2 = \frac{n(n+1)(2n+1)}{6} \approx \frac{1}{3}n^3$$

**4.** 
$$\sum_{i=1}^{n} i^{k} = 1^{k} + 2^{k} + \dots + n^{k} \approx \frac{1}{k+1} n^{k+1}$$

5. 
$$\sum_{i=0}^{n} a^{i} = 1 + a + \dots + a^{n} = \frac{a^{n+1} - 1}{a - 1} \ (a \neq 1); \quad \sum_{i=0}^{n} 2^{i} = 2^{n+1} - 1$$

**6.** 
$$\sum_{i=1}^{n} i2^{i} = 1 \cdot 2 + 2 \cdot 2^{2} + \dots + n2^{n} = (n-1)2^{n+1} + 2$$

7. 
$$\sum_{i=1}^{n} \frac{1}{i} = 1 + \frac{1}{2} + \dots + \frac{1}{n} \approx \ln n + \gamma$$
, where  $\gamma \approx 0.5772 \dots$  (Euler's constant)

8. 
$$\sum_{i=1}^{n} \lg i \approx n \lg n$$

# **Sum Manipulation Rules**

**1.** 
$$\sum_{i=1}^{u} ca_i = c \sum_{i=1}^{u} a_i$$

**2.** 
$$\sum_{i=l}^{u} (a_i \pm b_i) = \sum_{i=l}^{u} a_i \pm \sum_{i=l}^{u} b_i$$

3. 
$$\sum_{i=l}^{u} a_i = \sum_{i=l}^{m} a_i + \sum_{i=m+1}^{u} a_i$$
, where  $l \le m < u$ 

**4.** 
$$\sum_{i=1}^{u} (a_i - a_{i-1}) = a_u - a_{l-1}$$

## Approximation of a Sum by a Definite Integral

$$\int_{l-1}^{u} f(x)dx \le \sum_{i=l}^{u} f(i) \le \int_{l}^{u+1} f(x)dx \quad \text{for a nondecreasing } f(x)$$

$$\int_{l}^{u+1} f(x)dx \le \sum_{i=l}^{u} f(i) \le \int_{l-1}^{u} f(x)dx \quad \text{for a nonincreasing } f(x)$$

## Floor and Ceiling Formulas

The *floor* of a real number x, denoted  $\lfloor x \rfloor$ , is defined as the greatest integer not larger than x (e.g.,  $\lfloor 3.8 \rfloor = 3$ ,  $\lfloor -3.8 \rfloor = -4$ ,  $\lfloor 3 \rfloor = 3$ ). The *ceiling* of a real number x, denoted  $\lceil x \rceil$ , is defined as the smallest integer not smaller than x (e.g.,  $\lceil 3.8 \rceil = 4$ ,  $\lceil -3.8 \rceil = -3$ ,  $\lceil 3 \rceil = 3$ ).

- **1.**  $x 1 < \lfloor x \rfloor \le x \le \lceil x \rceil < x + 1$
- **2.**  $\lfloor x+n\rfloor = \lfloor x\rfloor + n$  and  $\lceil x+n\rceil = \lceil x\rceil + n$  for real x and integer n
- 3.  $|n/2| + \lceil n/2 \rceil = n$
- **4.**  $\lceil \lg(n+1) \rceil = \lfloor \lg n \rfloor + 1$

## Miscellaneous

- **1.**  $n! \approx \sqrt{2\pi n} \left(\frac{n}{e}\right)^n$  as  $n \to \infty$  (Stirling's formula)
- **2.** Modular arithmetic (n, m are integers, p is a positive integer)

$$(n+m) \mod p = (n \mod p + m \mod p) \mod p$$
  
 $(nm) \mod p = ((n \mod p)(m \mod p)) \mod p$
